CrossE: Score function for triple (h, r, t) :

$$f(h, r, t) = \sigma(\tanh(\mathbf{c}_r \circ \mathbf{h} + \mathbf{c}_r \circ \mathbf{h} \circ \mathbf{r} + \mathbf{b}) \mathbf{t}^\top)$$

What is a good embedding?

Link prediction results

Mean Rank

Capability of generating explanations for prediction

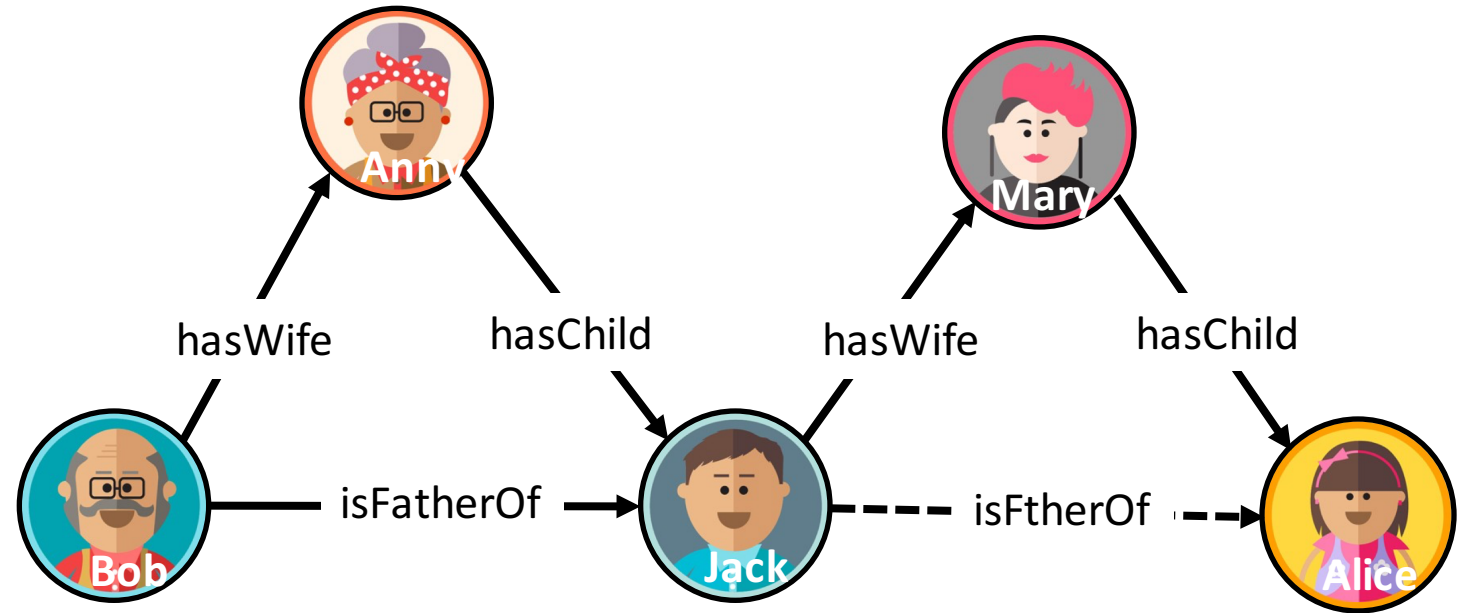

Capability of generating explanations for prediction

Generate explanation for prediction:

Step 1: search for similar relations of r .
 Step 2: search for path between h and t .
 Step 3: search for similar entities.
 Step 4: search for similar structure as supports.

Generating explanation experiment

Crossover interactions between entity and relation are common and should be considered by knowledge graph embedding methods.

Embeddings can be evaluated from multiple perspectives, not only link prediction performance but also the capability of **generating explanations** for prediction.

Thank you!
